

# Interactive Web Apps with shiny Cheat Sheet

learn more at [shiny.rstudio.com](http://shiny.rstudio.com)

## Basics

A **Shiny** app is a web page (**UI**) connected to a computer running a live R session (**Server**)

Users can manipulate the UI, which will cause the server to update the UI's displays (by running R code).

### App template

Begin writing a new app with this template. Preview the app by running the code at the R command line.

```
library(shiny)
ui <- fluidPage()
server <- function(input, output){}
shinyApp(ui = ui, server = server)
```

- **ui** - nested R functions that assemble an HTML user interface for your app
- **server** - a function with instructions on how to build and rebuild the R objects displayed in the UI
- **shinyApp** - combines **ui** and **server** into a functioning app. Wrap with **runApp()** if calling from a sourced script or inside a function.

### Share your app

 [shinyapps.io](http://shinyapps.io) The easiest way to share your app is to host it on shinyapps.io, a cloud based service from RStudio

1. Create a free or professional account at <http://shinyapps.io>
2. Click the **Publish** icon in the RStudio IDE (>=0.99) or run:  
`rsconnect::deployApp("<path to directory>")`

### Build or purchase your own Shiny Server

at [www.rstudio.com/products/shiny-server/](http://www.rstudio.com/products/shiny-server/)

## Building an App - Complete the template by adding arguments to `fluidPage()` and a body to the `server` function.

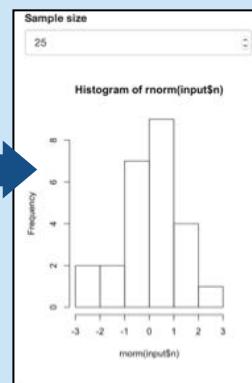

Add inputs to the UI with `*Input()` functions

Add outputs with `*Output()` functions

Tell server how to render outputs with R in the server function. To do this:

1. Refer to outputs with `output$<id>`
2. Refer to inputs with `input$<id>`
3. Wrap code in a `render*`() function before saving to output

```
library(shiny)
ui <- fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)
server <- function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
shinyApp(ui = ui, server = server)
```

Save your template as **app.R**. Alternatively, split your template into two files named **ui.R** and **server.R**.

```
library(shiny)
ui <- fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)
server <- function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
shinyApp(ui = ui, server = server)
```

```
# ui.R
fluidPage(
  numericInput(inputId = "n",
    "Sample size", value = 25),
  plotOutput(outputId = "hist")
)

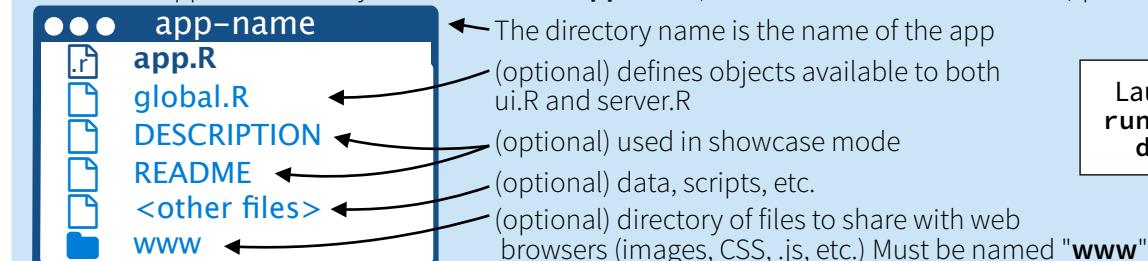

# server.R
function(input, output) {
  output$hist <- renderPlot({
    hist(rnorm(input$n))
  })
}
```

**ui.R** contains everything you would save to ui.

**server.R** ends with the function you would save to server.

No need to call `shinyApp()`.

Save each app as a directory that contains an **app.R** file (or a **server.R** file and a **ui.R** file) plus optional extra files.

Launch apps with  
`runApp(<path to directory>)`

## Outputs - `render*`() and `*Output()` functions work together to add R output to the UI

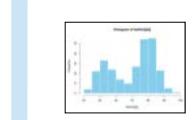

`DT::renderDataTable(expr, options, callback, escape, env, quoted)`

works with

`dataTableOutput(outputId, icon, ...)`

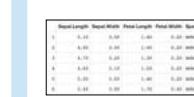

`renderImage(expr, env, quoted, deleteFile)`

`renderPlot(expr, width, height, res, ..., env, quoted, func)`

`renderPrint(expr, env, quoted, func, width)`

`renderTable(expr, ..., env, quoted, func)`

`renderText(expr, env, quoted, func)`

`renderUI(expr, env, quoted, func)`

`imageOutput(outputId, width, height, click, dblclick, hover, hoverDelay, hoverDelayType, brush, clickId, hoverId, inline)`

`plotOutput(outputId, width, height, click, dblclick, hover, hoverDelay, hoverDelayType, brush, clickId, hoverId, inline)`

`verbatimTextOutput(outputId)`

`tableOutput(outputId)`

`textOutput(outputId, container, inline)`

`uiOutput(outputId, inline, container, ...)`

& `htmlOutput(outputId, inline, container, ...)`

## Inputs - collect values from the user

Access the current value of an input object with `input $<inputId>`. Input values are **reactive**.

Action

`actionButton(inputId, label, icon, ...)`

Link

`actionLink(inputId, label, icon, ...)`

Choice 1  
 Choice 2  
 Choice 3  
 Check me

`checkboxGroupInput(inputId, label, choices, selected, inline)`

`dateInput(inputId, label, value, min, max, format, startview, weekstart, language)`

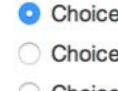

`fileInput(inputId, label, multiple, accept)`

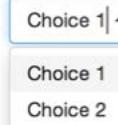

`numericInput(inputId, label, value, min, max, step)`

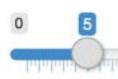

`passwordInput(inputId, label, value)`

`radioButtons(inputId, label, choices, selected, inline)`

`selectInput(inputId, label, choices, selected, multiple, selectize, width, size) (also selectizeInput())`

`sliderInput(inputId, label, min, max, value, step, round, format, locale, ticks, animate, width, sep, pre, post)`

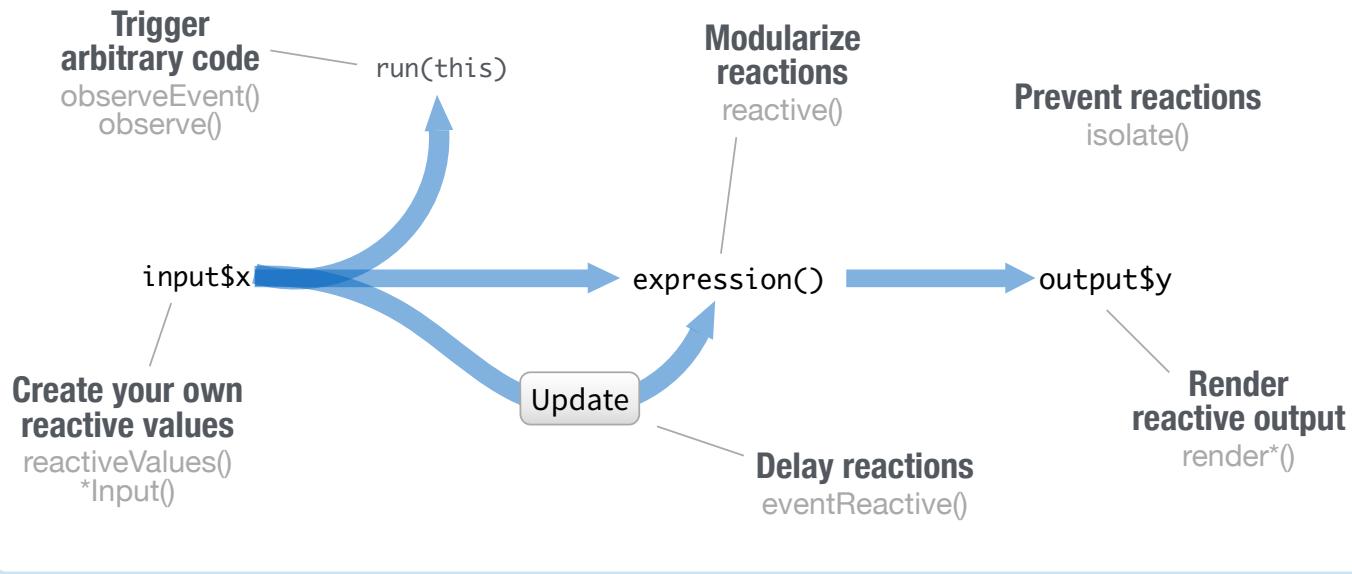

`submitButton(text, icon) (Prevents reactions across entire app)`

`textInput(inputId, label, value)`

# Reactivity

Reactive values work together with reactive functions. Call a reactive value from within the arguments of one of these functions to avoid the error [Operation not allowed without an active reactive context](#).

## Create your own reactive values

```
library(shiny)

ui <- fluidPage(
  textInput("a", ""))
server <- function(input, output){
  rv <- reactiveValues()
  rv$number <- 5
}
shinyApp(ui, server)
```

**\*Input()** functions  
(see front page)  
**reactiveValues(...)**

Each input function creates a reactive value stored as `input$<inputId>`  
`reactiveValues()` creates a list of reactive values whose values you can set.

## Render reactive output

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""))
server <- function(input, output){
  output$b <- renderText({
    input$a
  })
}
shinyApp(ui, server)
```

**render\*()** functions  
(see front page)

Builds an object to display. Will rerun code in body to rebuild the object whenever a reactive value in the code changes.

Save the results to `output$<outputId>`

## Prevent reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  textOutput("b"))
server <- function(input, output){
  output$b <- renderText({
    isolate({input$a})
  })
}
shinyApp(ui, server)
```

**isolate(expr)**  
Runs a code block. Returns a non-reactive copy of the results.

## Trigger arbitrary code

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  actionButton("go", ""))
server <- function(input, output){
  observeEvent(input$go, {
    print(input$a)
  })
}
shinyApp(ui, server)
```

**observeEvent(eventExpr, handlerExpr, event.env, event.quoted, handler.env, handler.quoted, label, suspended, priority, domain, autoDestroy, ignoreNULL)**

Runs code in 2nd argument when reactive values in 1st argument change. See `observe()` for alternative.

## Modularize reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  textInput("z", ""))
server <- function(input, output){
  re <- reactive({
    paste(input$a, input$b)
  })
  output$b <- renderText({
    re()
  })
}
shinyApp(ui, server)
```

**reactive(x, env, quoted, label, domain)**  
Creates a reactive expression that

- caches its value to reduce computation
- can be called by other code
- notifies its dependencies when it has been invalidated

Call the expression with function syntax, e.g. `re()`

## Delay reactions

```
library(shiny)
ui <- fluidPage(
  textInput("a", ""),
  actionButton("go", ""))
server <- function(input, output){
  re <- eventReactive(
    input$go, {input$a})
  output$b <- renderText({
    re()
  })
}
shinyApp(ui, server)
```

**eventReactive(eventExpr, valueExpr, event.env, event.quoted, value.env, value.quoted, label, domain, ignoreNULL)**

Creates reactive expression with code in 2nd argument that only invalidates when reactive values in 1st argument change.

# UI

An app's UI is an HTML document. Use Shiny's functions to assemble this HTML with R.

```
fluidPage(  
  textInput("a", "")  
)
```

## <div class="container-fluid">  
## <div class="form-group shiny-input-container">  
## <label for="a"></label>  
## <input id="a" type="text"  
## class="form-control" value="" />  
## </div>  
## </div>

Add static HTML elements with `tags`, a list of functions that parallel common HTML tags, e.g. `tags$a()`. Unnamed arguments will be passed into the tag; named arguments will become tag attributes.

tags\$a	tags\$data	tags\$h6	tags\$nav	tags\$span
tags\$abbr	tags\$datalist	tags\$head	tags\$object	tags\$strong
tags\$address	tags\$dd	tags\$header	tags\$optgroup	tags\$style
tags\$area	tags\$del	tags\$group	tags\$ol	tags\$sub
tags\$article	tags\$details	tags\$hr	tags\$option	tags\$summary
tags\$aside	tags\$dfn	tags\$HTML	tags\$output	tags\$sup
tags\$audio	tags\$div	tags\$i	tags\$p	tags\$table
tags\$b	tags\$dl	tags\$iframe	tags\$p	tags\$tbody
tags\$base	tags\$dt	tags\$img	tags\$param	tags\$td
tags\$bdi	tags\$em	tags\$input	tags\$progress	tags\$textarea
tags\$bdo	tags\$embed	tags\$ins	tags\$q	tags\$tfoot
tags\$blockquote	tags\$events	tags\$kbd	tags\$keygen	tags\$th
tags\$body	tags\$fieldset	tags\$label	tags\$ruby	tags\$thead
tags\$br	tags\$figcaption	tags\$figure	tags\$rp	tags\$time
tags\$button	tags\$button	tags\$footer	tags\$rt	tags\$title
tags\$canvas	tags\$caption	tags\$form	tags\$li	tags\$tr
tags\$caption	tags\$cite	tags\$form	tags\$link	tags\$track
tags\$code	tags\$code	tags\$h1	tags\$mark	tags\$u
tags\$col	tags\$col	tags\$h2	tags\$map	tags\$ul
tags\$colgroup	tags\$colgroup	tags\$h3	tags\$menu	tags\$var
tags\$command	tags\$command	tags\$h4	tags\$select	tags\$video
		tags\$h5	tags\$small	tags\$wbr

The most common tags have wrapper functions. You do not need to prefix their names with `tags$`

```
ui <- fluidPage(  
  h1("Header 1"),  
  hr(),  
  br(),  
  p(strong("bold")),  
  p(em("italic")),  
  p(code("code")),  
  a(href="", "link"),  
  HTML("<p>Raw html</p>"))

```

**Header 1**

bold  
italic  
code  
link  
Raw html

To include a CSS file, use `includeCSS()`, or

- Place the file in the `www` subdirectory
- Link to it with

```
tags$head(tags$link(rel = "stylesheet",  
type = "text/css", href = "<file name>"))
```

To include JavaScript, use `includeScript()` or

- Place the file in the `www` subdirectory
- Link to it with

```
tags$head(tags$script(src = "<file name>"))
```

To include an image

- Place the file in the `www` subdirectory
- Link to it with `img(src=<file name>")`

# Layouts

Combine multiple elements into a "single element" that has its own properties with a panel function, e.g.

```
wellPanel(  
  dateInput("a", ""),  
  submitButton())
)
```

absolutePanel()  
conditionalPanel()  
fixedPanel()  
headerPanel()

inputPanel()  
mainPanel()  
navlistPanel()  
sidebarPanel()

tabPanel()  
tabsetPanel()  
titlePanel()  
wellPanel()

Organize panels and elements into a layout with a layout function. Add elements as arguments of the layout functions.

**fluidRow()**

```
ui <- fluidPage(  
  fluidRow(column(4),  
           column(width = 2, offset = 3),  
           fluidRow(column(12)))
)
```

**flowLayout()**

```
ui <- fluidPage(  
  flowLayout(object1, object2, object3)
)
```

**sidebarLayout()**

```
ui <- fluidPage(  
  sidebarLayout(sidePanel, mainPanel)
)
```

**splitLayout()**

```
ui <- fluidPage(  
  splitLayout(object1, object2)
)
```

**verticalLayout()**

```
ui <- fluidPage(  
  verticalLayout(object1, object2, object3)
)
```

Layer tabPanels on top of each other, and navigate between them, with:
